

The Break Glass System

The Break Glass system gives you assurance that your hatcher will do everything it can to protect your valuable chicks for as long as possible while it waits for your team to fix the problem.

- System continues to function even if the main control malfunctions
- Designed to deal with the demanding conditions of a hatchery
- Completely free-standing system when purchased as an upgrade, or integrated into the standard control cabinet when sold with new equipment

Imagine a system that will take any or all of the following actions whenever a high temperature situation occurs:

- 1 - Cut the power to the normally open valve to ensure cooling medium will flow as long as there is pressure
- 2 - Make changes to ensure that the heating circuits are off
- 3 - Turn on any available blowers to increase or maintain airflow
- 4 - Attempt to open any powered dampers
- 5 - Attempt to turn on any available humidity spraying units
- 6 - Attempt to increase fan speed to maximum potential speed
- 7 - Attempt to activate the hatcher's audible alarm system.
